Galil B. 2001. — The Calappidae of the Marquesas Islands with a description of a new species of *Mursia* (Crustacea, Decapoda, Brachyura). *Zoosystème* 23 (3) : 499-505.

ABSTRACT

A study of the extensive collection of calappid crabs made by the MUSORSTOM 9 expedition to the Marquesas Archipelago provided an opportunity to update and revise the list of species known from the islands and revealed a new species. *Mursia poupini* n. sp. is easily distinguished from the other *Mursia* species with crook-shaped second male pleopod (*M. africana*, *M. flamma*, *M. microspina*). *M. poupini* n. sp. differs from *M. africana* in its much shorter lateral spine; from *M. flamma* in the shape of the lower horizontal row on outer palmar face, and in lacking the sharply triangular teeth on posterior margin of carapace; from *M. microspina* in its longer lateral spine, in the shape of the lower horizontal row on outer palmar face, and in lacking the large oculus-shaped patch on inner palmar face.

RÉSUMÉ

*Les Calappidae des îles Marquises et description d'une nouvelle espèce de *Mursia* (Crustacea, Decapoda, Brachyura).*

L'étude d'une importante collection de Clappidae, récoltés par l'expédition MUSORSTOM 9 dans les îles Marquises, fournit l'occasion de mettre à jour et de réviser la liste des espèces de ces îles et de décrire une nouvelle espèce. *Mursia poupini* n. sp. se distingue facilement des autres espèces de *Mursia* (*M. africana*, *M. flamma* et *M. microspina*) qui ont le second pléopode du mâle en crochet. *M. poupini* n. sp. diffère de *M. africana* par son épine latérale beaucoup plus courte ; de *M. flamma* par la forme de la rame horizontale inférieure sur sa face palmaire externe et par l'absence de dents triangulaires aiguës sur la limite postérieure de la carapace ; de *M. microspina* par son épine latérale plus longue, la forme de la rame horizontale inférieure sur sa face palmaire externe et l'absence de la grosse tache en forme d'oculus sur sa face palmaire interne.

INTRODUCTION

The Marquesas Archipelago in the Central Pacific is an isolated group of volcanic islands, at the poor extremity of the Indo-Pacific biodiversity gradient. The MUSORSTOM 9 expedition to the Marquesas sampled the benthos, from the intertidal to the upper-bathyal, by land-based and vessel-based scientists (Richer de Forges *et al.* 1999). The 240 decapod and stomatopod crustaceans that have been reported from the Marquesas (Richer de Forges *et al.* 1999) include several calappid crabs. The study of the extensive collection of calappid crabs made by the MUSORSTOM 9 expedition provided an opportunity to update and revise those records, and revealed a new species of the deep-sea calappid genus *Mursia* Desmarest, 1823.

SYSTEMATICS

Genus *Ashtoret* Galil & Clark, 1994

Ashtoret picta (Hess, 1865)

Matuta picta Hess, 1865: 158, pl. 6 (13).

Matuta banksii – Rathbun 1907: 68.

Ashtoret lunaris – Poupin 1996a: 25.

DISTRIBUTION. — Red Sea, Ceylon, Maldives and Andaman Island, Indonesia, Hawaiian Island, Marquesas Islands, 9-305 m (Galil & Clark 1996: 198).

DESCRIPTION

Color

C. marisrubri displays a marked difference in color between male and female specimens. Male

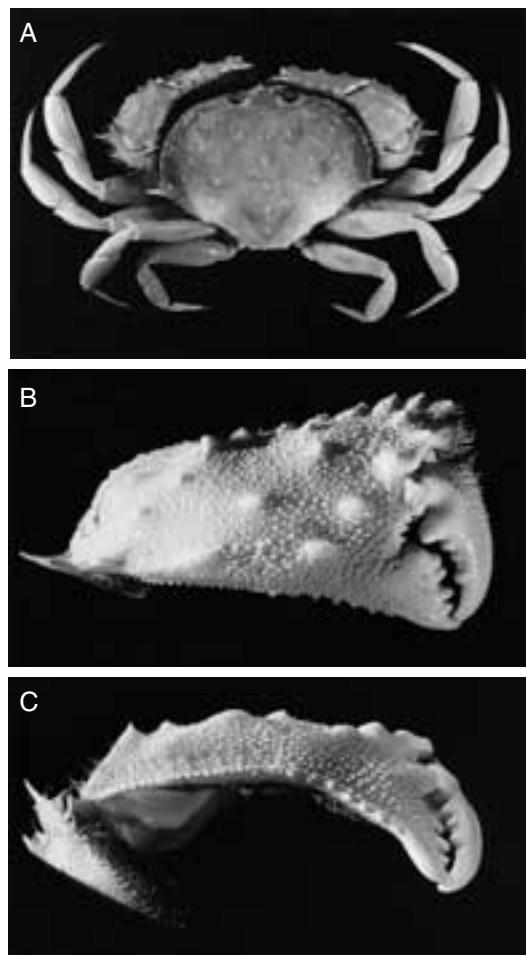

FIG. 3. — *Mursia pouponi* n. sp., ♂ paratype cl 48.9 mm, Eiao I., stn DW 1269, 7°56'S, 140°43'W, 420-430 m, 4.IX.1997 (MNHN B27633); A, dorsal view; B, left cheliped, external surface; C, left cheliped, lower margin.

carapace and legs are uniformly purple, the inner palmar face with small purple patch at base of dactylus. Female carapace and chelipeds are tan with irregularly reticulate reddish markings.

Genus *Mursia* Desmarest, 1823

Mursia pouponi n. sp. (Figs 3; 4)

TYPE MATERIAL. — Holotype ♂, Dumont d'Urville Plateau, stn CP 1251, 9°47'S, 139°38'W, 500-650 m, 2.IX.1997, cl 41.0 mm (MNHN B27632); paratype ♂, Eiao I., stn DW 1269, 7°56'S, 140°43'W, 420-430 m, 4.IX.1997, cl 48.9 mm (MNHN B27633).

FIG. 4. — *Mursia poupinii* n. sp., ♂ holotype, cl 41.0 mm, Dumont d'Urville Plateau, stn CP 1251, 9°47'S, 139°38'W, 500-650 m, 2.IX.1997 (MNHN B27632), dorsal view.

ETYMOLOGY.— Named in honor of Joseph Poupin, in appreciation for his role in exploring the decapod fauna of French Polynesia.

DISTRIBUTION.— Known only from the type location – Marquesas Islands.

DESCRIPTION

Carapace convex, transversely ovate, 1.3 wide as long. Dorsal surface of carapace granulate; radial ridges little defined, bearing low granulate tubercles. Front wider than orbit, trilobate; median lobe triangular, projecting beyond lateral lobes. Gastric, cardiac, intestinal regions bordered laterally by shallow groove. Anterolateral margin arcuate, granulate, bearing nine granulate tubercles. Lateral spine 0.1 carapace width, granular. Posterolateral margin sharply convergent, beaded. Posterior margin bearing laterally a rounded denticle.

Eyes filling orbit, eyestalk short, granulate, setose, cornea large. Orbital margins with long plumose

setae. Supraorbital margin unifissured. Inner orbital tooth separated from orbital margin by wide hiatus opening to oblique subhepatic canal. Subhepatic region minutely granulate. Third maxilliped not covering anterior part of buccal cavity, ischium of endopod with granulate row distally forming stridulating organ when rasped against milled ridge on dactylus of chela. Chelipeds massive, subequal, granulose. Merus distally bispinose, distal spine twice as long as proximal spine. Superior margin of carpus distally dentate. Upper margin of palm crested, cut into eight denticles. External surface of palm prominently granulate, with larger, closer granules ventrally; bearing two tubercles below crest, two longitudinal rows of three granulate tubercles and with granular ridge, unevenly trilobate, with keel-like proximal lobe, broad median lobe, smaller distal lobe; lower margin serrate. Internal surface of palm with thick pilose band near lower margin.

Dactyl granulose on outer surface, bearing stridulating crest on inner surface. Dactyl of larger cheliped bearing large curved tooth basally, fitting into molariform teeth on pollex. Pereiopods large, laterally compressed, dactyli long, styliform. Pereiopodal meri with upper, lower margins granulose, upper margin of carpi costate, granulate. Male abdomen prominently crested on second segment, crest bifissured, medially concave; segments 3-5 fused; 6th segment subquadrate, its lateral margins slightly concave. Telson triangular, slightly shorter than 6th segment. First male pleopod stout, tapering, curved distad, distally spinulose. Second male pleopod long, slender, distally crook-shaped, tip slightly recurved.

Color

Carapace and pereiopods dull orange, diffuse reddish crescents surround posteriorly carapacial tubercles. Inner palmar face with small patch at base of dactylus.

REMARKS

M. poupinii n. sp. is easily distinguished from the other *Mursia* species with crook-shaped second male pleopod – *M. africana* Galil, 1993, *M. flamma* Galil, 1993, *M. microspina* Davie & Short, 1989; *M. poupinii* n. sp. differs from *M. africana* in its much shorter lateral spine; from *M. flamma* in the shape of the lower horizontal row on outer palmar face, and in lacking the sharply triangular teeth on posterior margin of carapace; from *M. microspina* in its longer lateral spine, in the shape of the lower horizontal row on outer palmar face, and in lacking the large oculus-shaped patch on inner palmar face.

Acknowledgements

I thank Alain Crosnier for generously entrusting me with the material. My visit to the Muséum national d'Histoire naturelle, Paris, was funded by PARSYST. Mr P. Laboute took the color photographs, Mr A. Shoob, the black and white photographs.
