

**Taxonomy of the Neotropical freshwater crab family Trichodactylidae, IV.
The genera *Dilocarcinus* and *Poppiana*
(Crustacea, Decapoda, Trichodactylidae)**

CÉLIO MAGALHÃES & MICHAEL TÜRKAY

Abstract

The genera *Dilocarcinus* and *Poppiana* (tribe Dilocarcinini) of the freshwater crab family Trichodactylidae are revised. These genera each include three species, i.e.: *Dilocarcinus septemdentatus* (HERBST 1783), *D. pagei* STIMPSON 1861, and *D. truncatus* RODRIGUEZ 1992; *Poppiana dentata* (RANDALL 1840), *P. argentiniana* (RATHBUN 1905), and *P. bulbifer* (RODRIGUEZ 1992). The taxonomic status of all species is discussed and a short diagnosis for each is provided. Lectotypes for *P. argentiniana* (♂ in MNHN-collection) and *P. dentata* (♂ in ANSP-collection) are designated. A complete list of the material examined, and maps showing the geographic distribution, are given.

K e y w o r d s : Taxonomy, freshwater, crabs, Trichodactylidae, *Dilocarcinus*, *Poppiana*.

**Taxonomie der neotropischen Süßwasserkrabbenfamilie Trichodactylidae, IV. Die Gattungen
Dilocarcinus und *Poppiana* (Crustacea, Decapoda, Trichodactylidae)**

Z u s a m m e n f a s s u n g : Die Gattungen *Dilocarcinus* und *Poppiana* (Tribus Dilocarcinini) der Süßwasserkrabbenfamilie Trichodactylidae werden revidiert. Diese Gattungen enthalten je 3 Arten: *Dilocarcinus septemdentatus* (HERBST 1783), *D. pagei* STIMPSON 1861 und *D. truncatus* RODRIGUEZ 1992, *Poppiana dentata* (RANDALL 1840), *P. argentiniana* (RATHBUN 1905) und *P. bulbifer* (RODRIGUEZ 1992). Der taxonomische Status aller Arten wird diskutiert und es werden Diagnosen für die einzelnen Arten gegeben. Für *P. argentiniana* und *P. dentata* werden Lectotypen designiert (*P. argentiniana*: ♂ MNHN; *P. dentata*: ♂ ANSP). Eine vollständige Materialliste und Verbreitungskarten sind enthalten.

Introduction

MAGALHÃES & TÜRKAY (1996a) started a taxonomic revision of the Neotropical trichodactylid crabs by presenting their proposal for systematic grouping of the infrafamiliar taxa, which was based on complexes of characters, drawn mainly from the sternum, the endophragmal system, the abdomen segmentation and the morphologies of the first and second male pleopods. That introductory paper was fol-

lowed by others dealing with the taxonomy of some genera of the Valdiviini (MAGALHÃES & TÜRKAY 1996b) and the Dilocarcinini (MAGALHÃES & TÜRKAY 1996c). After a long break we now are following up these earlier revisionary publications with the present review of the genera *Dilocarcinus* and *Poppiana* (tribe Dilocarcinini). In order to enable definitive identification, keys to the species for each

Authors' addresses:

michael.tuerkay@senckenberg.de

genus, and illustrations of the carapace and the male first pleopods, are provided. A brief diagnosis and remarks on intraspecific variability are given for each species.

The history of the genus *Dilocarcinus* is long and complicated. It has been used by earlier authors to accommodate a large number of unrelated species on the basis of external characters. We refer to our earlier publication for a full synonymy. In his most recent revisionary work RODRÍGUEZ (1992) had still presented a very inclusive concept of *Dilocarcinus*, including 11 species. MAGALHÃES & TÜRKAY (1996a), based on the examination of a large amount of material from many different areas in South America and most of the type specimens, argued that existing differences in the male first pleopod and abdominal segmentation show that *Dilocarcinus* sensu RODRIGUEZ (1992) was a highly heterogeneous assemblage. They separated the species into 4 genera, reviving BOTT's (1969) *Poppiana* and *Goyazana*, and erecting *Bottiella* and *Moreirocarcinus* as new ones.

Materials and methods

The measurements given in the descriptions of the individual species, where available, refer to (in mm): Carapace breadth: Carapace length: Body height: Frontal breadth. Sometimes, the last two values are missing; in such cases, the measurements refer to: Carapace breadth: Carapace length. Measurements of the type and the largest specimen examined are usually given. The terminology used for gonopod description has been explained in MAGALHÃES & TÜRKAY (1996a); the number of the anterolateral carapace teeth includes neither the exorbital angle (when toothed), nor the accessory tooth sometimes present at base of the exorbital angle; plp 1 and plp 2 were used for referring to the first and second male pleopods, respectively.

Type specimens of all species were examined, except where noted otherwise.

Synonymic lists include mainly synonymies after 1969; see BOTT (1969) for synonymies until that year.

The repositories of the specimens studied for the present paper are the following institutions:

ANSP	Museum of the Academy of Natural Sciences of Philadelphia.

Systematic part

Dilocarcinus H. MILNE EDWARDS 1853

Dilocarcinus: H. MILNE EDWARDS (1853: 215). — Type-species: *Dilocarcinus spinifer* H. MILNE EDWARDS 1853 [by subsequent designation: PRETMANN 1968].

Dilocarcinus — RODRÍGUEZ (1992: 108 [part.]); MAGALHÃES & TÜRKAY (1996: 78); MAGALHÃES (1998: 519; 2003: 202); CAMPOS (2005: 75); NG et al. (2008: 187).

Key to the species

- 1 Anterior margin of third abdominal segment without transversal carina 2
- 1* Anterior margin of third abdominal segment with a clearly elevated transversal carina in both sexes *D. pagei*
- 2 Plp 1 with distal portion slightly to strongly curved in lateral direction; apex a little compressed, subtriangular projection extending distally beyond or as far as the subdistal lobe; distal opening directed laterally *D. septemdentatus*
- 2* Plp 1 with distal portion straight, not curved in lateral direction; apex very short and straight, reaching distally to middle of subdistal lobe; distal opening directed apically *D. truncatus*

Dilocarcinus septemdentatus (HERBST 1783)

(Figs. 1–7)

Cancer septemdentatus: HERBST (1783: 155). — Type locality: BOTT (1969) restricted the type locality to the lower Amazon (Brazil, state of Pará, surroundings of Belém). — Holotype: Not examined [probably not extant, as it could not be found at the ZMB neither by us nor by SAKAI (1999)].

Dilocarcinus spinifer: H. MILNE EDWARDS (1853: 215).

Dilocarcinus castelnau — H. MILNE EDWARDS (1853: 216 [part., 1 ♂, MNHN 3866]; 1854: 182 [part., 1 ♂, MNHN 3866]).

Dilocarcinus (*Dilocarcinus*) *septemdentatus* — BOTT (1969: 44, pl. 8, figs. 14a–b; pl. 20, fig. 45).

Dilocarcinus septemdentatus — RODRÍGUEZ (1981: 48; 1992: 128); MAGALHÃES & TÜRKAY (1996: 67, 69, 78, figs. 17, 23, 24); MAGALHÃES (1998: 519; 2003: 203, 206, figs. 108–109); BARROS & PIMENTEL (2001: 32); NG et al. (2008: 187).

Dilocarcinus (*Dilocarcinus*) *spinifer* — BOTT (1969: 45, pl. 8, figs. 15a–b; pl. 20, fig. 46).

Dilocarcinus spinifer — RODRÍGUEZ (1981: 48; 1992: 128, figs. 45A–I); HOLTHUIS (1993: 9); PEREIRA & BERRENSTEIN (2003: 58).

Peru: Depto. de Loreto: 1 ♂ (MZUSP 9248), rio Ampiyacu, 15.–25. iv. 1966, B. MALKIN; 1 ♀ (MZUSP 2399), idem; 1 ♀ (FMNH 3632), rio Ampiyacu, 28. iii.–9. iv. 1970, B. MALKIN.

Without precise locality: 2 ♂♂, dry (MNHN 3868), Voyage dans l'int. de l'Amer. du Sud, F. DE CASTELNAU & E. DEVILLE.

Diagnosis: Carapace smooth, strongly convex longitudinally. Frontal margin unarmed, slightly bilobed; anterolateral margins with 6 (usually) or 7 acute teeth behind the external orbital tooth. Abdominal somites III–VI fused; somite III smooth, without transversal carina along the anterior margin. Male plp 1 with distal portion slightly to strongly bent in lateral direction. Lateral border gently sinuous, with a few short setae medially. Lateroventral side with a rounded subdistal lobe. Marginal suture running along the mesial side of the stem, twisted towards the lateral side near the apex, after having passed the subdistal lobe. Subterminal spine fields continuous, denser on the lateroventral side, along the subdistal lobe, extending distally to the dorsal side. Subapical setae sometimes absent. Apex strongly twisted towards the lateral side, with a compressed, subtriangu-

lar projection extending distally beyond or to the level of the subdistal lobe; distal opening very narrow, directed laterally.

Measurements: 53.0:40.0 (largest specimen, ♂, MPEG 697).

Distribution: Coastal river basins of northern South America (Suriname, French Guyana and Brazil) and lowlands of the Amazon Basin in Brazil and Peru (Fig. 7).

Remarks: The ♂ plp 1 displays some variability in the degree of curvature and the twisting of the apex as well as in the bulging of the subdistal lobe of the lateroventral side. The variability of the chelipeds and carapace dentition was commented on by HOLTHUIS (1959).

Our study of abundant specimens from a more widespread range of distribution does not support the separation of *D. septemdentatus* and *D. spinifer* into 2 distinct species as advocated by BOTT (1969) and RODRIGUEZ (1992), based on the curvature of the apex of the plp 1 and in their distributional range. The distal part of the plp 1 shows various degrees of bending towards the lateral side, even among specimens from the same region. Some specimens from Suriname (e.g., RMNH D 20711, from Granmankanare, rio Saramacca) (Fig. 3) have a plp 1 with an almost 70° angle of curvature and a prominent subdistal lobe, in some others (e.g., RMNH D 21790, from Ligorio) the apex is moderately curved (approximately 40°), and in most of them it is almost straight with a discreet subdistal lobe (e.g., SMF 4887, from vicinity of Botopasi) (Fig. 2). The same situation is observed in the Amazon region, where specimens from rio Gurupi Basin (eastern Amazon) have an apex clearly bent (e.g., MZUSP 1800) or almost straight (e.g., MZUSP 1806, 1807) (Fig. 4a,b); similarly, Central Amazonian specimens can either have a curved or an almost straight apex, as shown in the two specimens of the lot INPA 1255 (Figs. 5, 6).

RATHBUN (1906b: 62) pointed out that H. MILNE EDWARDS (1853) described *D. castelnauui* based on 3 individuals, 2 of which (1 ♂ and 1 ♀) actually belonged to *D. castelnauui*; the third one, a ♂, was *T. (D.) spinifer*, now a synonym of the present species. BOTT (1969: 49) contested her, arguing that the differences between them were probably caused by variation due to age. Our re-examination of the type series of *Goyazana castelnauui* proved that, in fact, 1 ♂ specimen (MHN 3866) belongs to *D. septemdentatus*, whereas the other 2 are the LT and PLT of *G. castelnauui* (H. MILNE EDWARDS 1853) (see MAGALHÃES & TÜRKAY 1996c).

Dilocarcinus pagei STIMPSON 1861 (Figs. 8–11)

Dilocarcinus pagei: STIMPSON (1861: 373). — Type locality: Paraguay. — Holotype: ♀, dry (USNM 2463), Paraguay, leg. PAGE.

Dilocarcinus septemdentatus — MOREIRA (1901: 49 [part., Colonia Risso and Resistencia]).

Dilocarcinus (Dilocarcinus) pagei pagei — BOTT (1969: 46, pl. 9, figs. 16a–b; pl. 20, fig. 47); LOPRETTI (1976: 68, 84, figs. 26–29); MANNING & HOBBS (1977: 159).

Dilocarcinus pagei pagei — MAGALHÃES & TÜRKAY (1996a: 67, 69, 78).

Dilocarcinus (Dilocarcinus) pagei cristatus: BOTT (1969: 47, pl. 9, figs. 17a–b; pl. 20, fig. 48).

Dilocarcinus (Dilocarcinus) pagei cristatus — LOPRETTI (1976: 68, 86, figs. 14–17).

Dilocarcinus (Dilocarcinus) pagei enriquei: PRETMANN (1978: 168, fig. 10).

Dilocarcinus (Dilocarcinus) pagei enriquei — PRETMANN (1983a: 309, pl. 1, fig. 3; pl. 2, fig. 8; pl. 3, fig. 12; pl. 4, fig. 14; pl. 5, fig. 20; 1983b: 324).

Dilocarcinus (Dilocarcinus) pagei enricei — PRETMANN (1983b: 318 [error]).

Dilocarcinus pagei enriquei — NG et al. (2008: 187).

Dilocarcinus (Dilocarcinus) pagei — LOPRETTI (1981: 23, pl. 1, figs. 1–8; pl. 2, figs. 9–34; pl. 3, figs. 35–42); ZWINK (1990: 103).

Dilocarcinus pagei — RODRIGUEZ (1981: 48; 1992: 125, figs. 1B, 4AA, 8I, 13J, 14D, 44D–G);.

Dilocarcinus pagei — MORRONE & LOPRETTI (1994: 100, fig. 19; 1995: 4; 1996: 71);

Dilocarcinus pagei — MAGALHÃES (1998: 519; 2000: 59, 178, 288, 289; 2001: 70, 133, 138; 2002: 1100; 2003: 203, 204, figs. 106–107); BARROS & PIMENTEL (2001: 32); CAMPOS (2005: 75, figs. 17A–I); MAGALHÃES et al. (2005: 1934, fig. 1 (5)); NG et al. (2008: 187).

Dilocarcinus pagei [sic!] — GOULDING et al. (1988: 67 [erroneous spelling]).

Diagnosis: Carapace smooth, strongly convex longitudinally. Frontal margin unarmed, bilobed; antero-lateral margins with 6 (usually) or 7 acute teeth behind the external orbital tooth. Abdominal somites III-VI fused; somite III with a distinct transversal carina along the anterior margin. Male plp 1 with its distal portion slightly bent in lateral direction. Lateral border gently sinuous, bearing long and short setae medially. Latero-ventral side with a rounded subdistal lobe. Marginal suture running along the mesial side of the stem, slightly twisted towards the lateral side near apex after having passed the subdistal lobe. Subterminal spine fields continuous, denser on the lateroventral side, extending distally to the dorsal side, where it is less dense. Dorsal side bearing a dense tuft of short and long setae subdistally. Apex short and flat, somewhat twisted towards the lateral direction; distal opening very narrow.

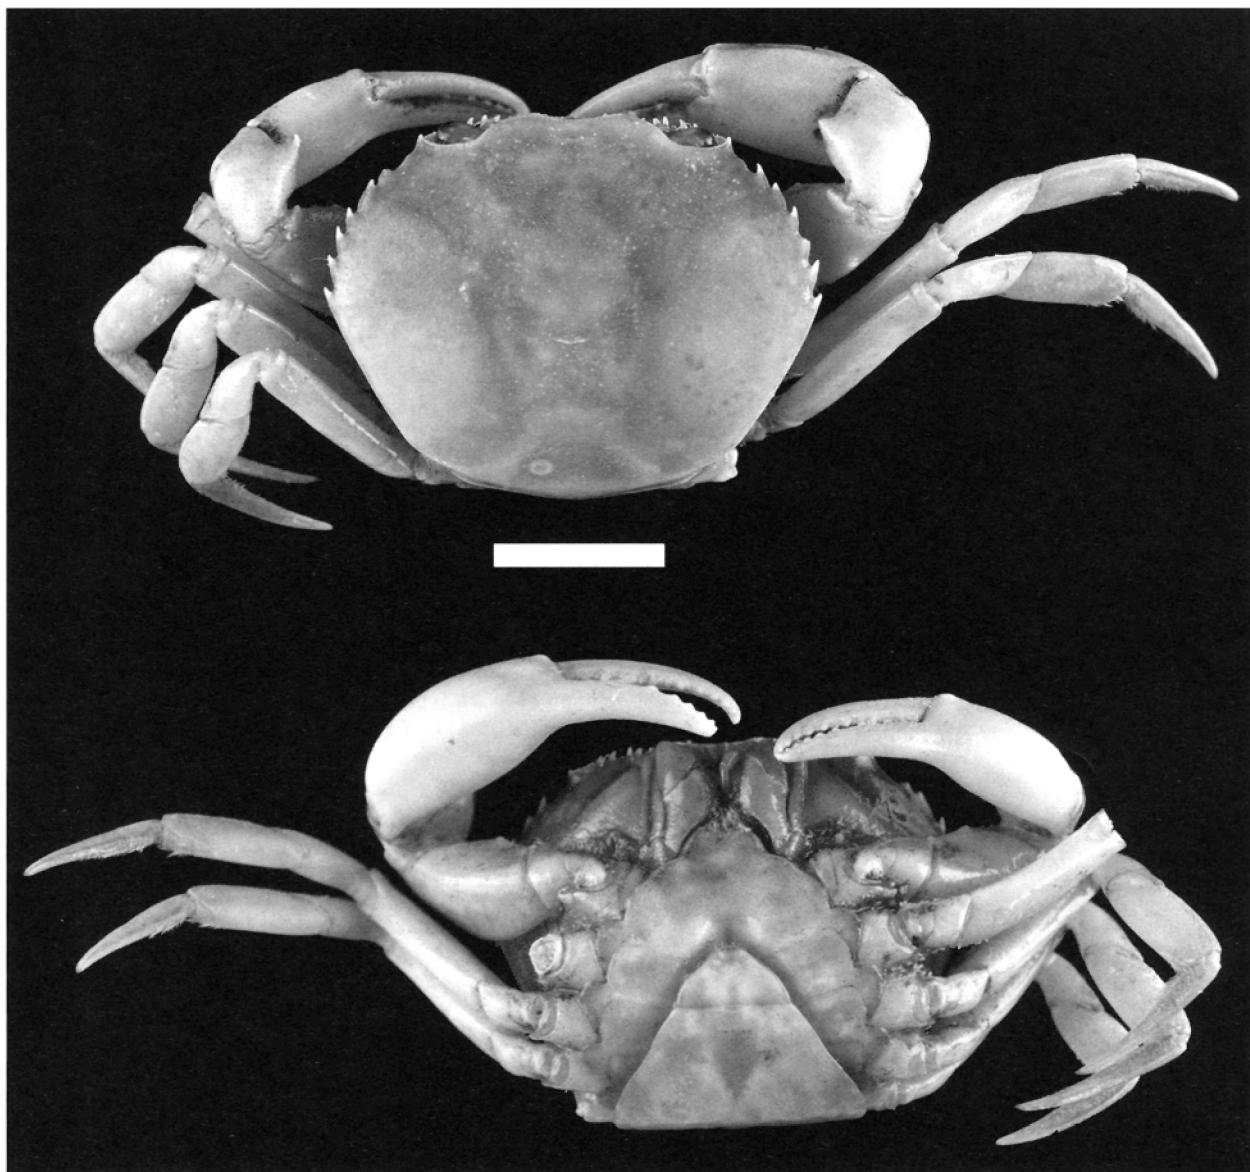

Fig. 12. *Dilocarcinus truncatus*: ♂ HT, ZMH K-3682. — Scale 1 cm.

Measurements: 47.9:39.5 (♀, HT); 63.8:50.9 (largest specimen, ♂, ZMB 12400).

Distribution: Lowlands of the Amazon and the Paraguay-Paraná River Basins, in Brazil, Colombia, Peru, Bolivia, Paraguay and Argentina (Fig. 11).

Remarks: Both ♂ and ♀ of *D. pagei* are readily recognised by the transversal carina along the anterior margin of the third abdominal somite. This species is distributed throughout the lowland habitats of the Amazon and Paraguay/lower Paraná River Basins. Its occurrence in the upper Rio Parana Basin (states of São Paulo and Paraná) is most probably due to anthropogenic dispersal (MAGALHÃES et al. 2005).

LOPRETTO (1981) synonymised the subspecies, *D. pagei cristatus*, erected by BOTT (1969a), after verifying that homo- and heterochely is present within the same population. The present study, based on material from the whole distributional area, corroborates this decision.

D. pagei enriquei was erected by PRETMANN (1978) based on a single ♂ specimen from the western Amazon region of Peru. The examination of the HT showed that the plp 1 morphology (Fig. 10a, b) is similar to that of the nominotypical form, in spite of some distinctive characters in the carapace and pereiopods. The carapace is dorsally uneven, and the dactyls of the walking legs are longer and more slender than in the nominotypical form (the relation length of dactyl/length of propodus is greater than 1.8 in the HT of *D. pagei enriquei*, but it does not exceed 1.7 in the nominotypical form). Such differences in the outer morphology led MAGALHÃES & TÜRKAY (1996a: 78) to keep the subspecific differentiation, as no further specimens from western Amazon were available at that moment. However, the examination of recent collections from Peru (rio Ucayali and surrounding areas of the *D. pagei enriquei* type-locality) showed that those characters are not present in any other speci-

men from that region. Due to this, we suspect that the HT of *D. pagei enriquei* is an abnormal specimen and propose now to consider this taxon as a synonym of *D. pagei*. If more specimens with such characters show up in the future, the problem has to be reconsidered.

***Dilocarcinus truncatus* RODRIGUEZ 1992**

(Figs. 7, 12–13)

Poppiana argentinianus — BOTT (1969: 52 [part., 1 ♂ MHa 3672 (= 3682)]).

Dilocarcinus truncatus: RODRIGUEZ (1992: 111, figs. 3K, 8G, 13I, 14C, 39A-E). — Type locality: Bolivia, Prov. Beni, rio Beni, Riberalta [$10^{\circ}59' S$, $66^{\circ}6' W$]. — Holotype: ♂ (ZMH K-3682), Bolivia, Prov. Beni, rio Beni, Riberalta, 27. VIII. 1909, leg. WINKELMANN.

Dilocarcinus truncatus — MAGALHÃES & TÜRKAY (1996: 67, 69, 78); MORRONE & LOPRETTTO (1996: 71); MAGALHÃES (2002: 1100); NG et al. (2008: 187).

No additional material available for study.

Diagnosis: Carapace smooth, moderately convex longitudinally. Frontal margin unarmed, slightly bilobed;

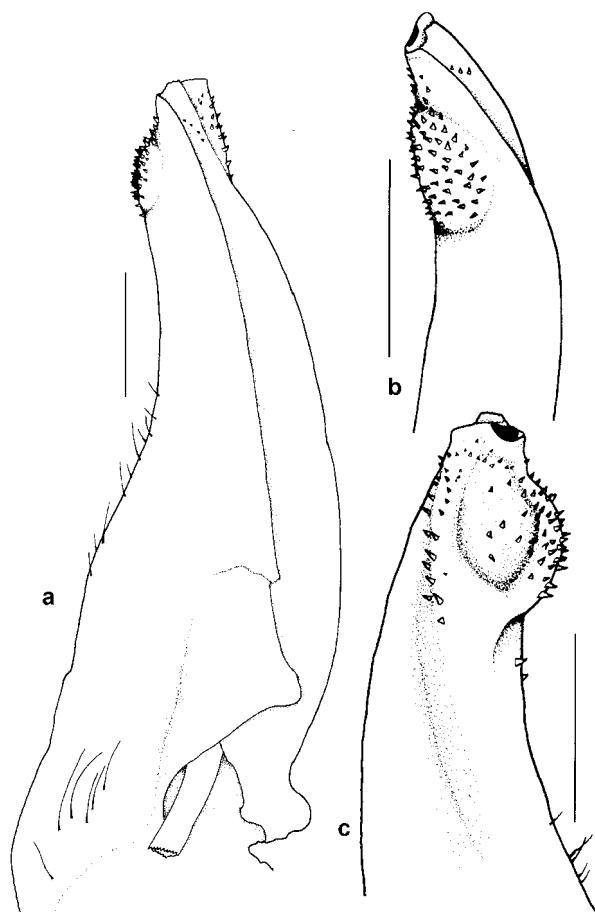

Fig. 13. *Dilocarcinus truncatus* (HT, ZMH K-3682), right plp 1. a. total, ventro-mesial aspect; b. tip, lateral aspect; c. tip, dorso-lateral aspect. — Scales 1 mm.

anterolateral margin with a small, rounded accessory tooth and 6 acute teeth behind external orbital tooth. Abdominal somites III–VI fused; somite III smooth, not crested. Male plp 1 with lateral border slightly concave, with a few scattered setae medially; mesial border slightly convex. Distal portion nearly straight, with a conspicuous rounded subdistal lobe on the lateral side, grooved on the dorsal side; terminal extension of the mesial border twisted towards the ventral side, forming a longitudinal ridge slightly produced beyond the distal border. Marginal suture running along the mesial side of the stem, slightly twisted towards the lateral side at the apex. Subterminal spine fields mostly discontinuous, with a denser patch on the lateroventral side, along the subdistal lobe; a longitudinal patch on the mesiodorsal side; some scattered small spines on the excavated dorsal side; and a single, transversal row of small spines on the mesial side. Subapical setae absent. Apex very short, distal border nearly straight; distal opening small and narrow, directed apically.

Measurements: 28.0:22.8:14.8:9.0 (♂, HT).

Distribution: Currently only known from the type locality in Bolivia (Fig. 16).

Remarks: This species can easily be distinguished from *D. pagei* by the anterior border of the 3rd abdominal somite lacking the transversal carina, and from *D. septemdentatus* by the peculiar morphology of the apex of the plp 1. In *D. truncatus*, the apex is straight and very short, not extending apically beyond the midline of the subdistal lobe, while in *D. septemdentatus* the apex is relatively long, extending apically at least to the end of the subdistal lobe, and presents various degrees of lateral bending.

***Poppiana* BOTT 1969**

Poppiana: BOTT (1969: 49 [part.]). — Type-species: *Orthostoma dentata* RANDALL 1840 [by original designation].

Poppiana — MAGALHÃES & TÜRKAY (1996: 82); MAGALHÃES (2003: 224); CAMPOS (2005: 79); NG et al. (2008: 187).

Key to the species

- | | | |
|----|--|------------------------|
| 1 | Frontal margin unarmed, smooth | 2 |
| 1* | Frontal margin armed with several acute spines | <i>P. dentata</i> |
| 2 | Plp 1 with ventral margin following a regular curve, without a distinct subdistal lobe | <i>P. argentiniana</i> |
| 2* | Plp 1 with ventral margin bearing a strong subdistal bulbiform lobe | <i>P. bulbifer</i> |

Arauca: 1 ♂, 4 ♀♀ (ICN-MHN 628), Puerto Rondón, Estación de Biología Experimental El Guafal, 125 m altitude, 19. ix. 1985, A. ARIAS. — Dept. Córdoba: 1 ♂ (ICN-MHN 2100), Montería, Ciénaga de Betancí, Caño Betancí, en

Loma de Pepo, Maracayo, 80 m altitude, 8°24' N, 75°53' W, 29. xi. 2003, G. CÁRDENAS.

No locality indicated: 1 ♂ (NHMW 6662); 1 ♀ (USNM 234440); 2 ♂♂ (ZSM 1090-3).

Diagnosis: Carapace smooth, strongly convex longitudinally; frontal margin spined, bilobed; antero-lateral margins with 7–9 small, acute teeth, and a small accessory tooth just behind the external orbital tooth. Abdominal somites III–VI fused. ♂ plp 1 with distal portion slightly bent in lateral direction. Marginal suture running on the mesial side, totally displaced to the dorsal side near the apex. Distal opening narrow and terminal; its borders rolled up, lateral border forming a small apical projection, mesio-dorsal border rolled up towards the dorsal side. Subterminal spine fields poorly developed, discontinuous, with a reduced patch on the dorsal surface, and 2 larger patches on the mesial and lateral surfaces.

Measurements: 3 ♂♂ (41.5:32.9; 51.2:38.5; 58.8:43.3 — largest specimen), 1 ♀ (46.8:32.9) (STs).

Distribution: Trinidad, coastal river basins of northwestern and northern South America (Colombia, Venezuela, Guyana, Suriname and French Guyana), Orinoco drainage (Venezuela and Colombia) and Rio Negro drainage (Brazil) (Fig. 16). VON MARTENS' (1869) record to the state of Bahia in Brazil ("perhaps Bahia") is highly doubtful, as the distributional area of this species seems to be clearly delimited along the northern part of South America, with its southern and eastern limits reaching, respectively, the northern tributaries of the Rio Negro Basin, in Brazil, and the coastal river basins of French Guiana.

An additional records from Colombia was published by PEARSE (1921: río Fundación, Dept. Magdalena).

The present species is now recorded for the first time from Nicaragua and the collection data seem to be trustworthy. This is the second record of a trichodactylid crab from Central America south of Mexico, besides the one made by RATHBUN (1893) for the type locality of *Trichodactylus quinquedentatus*, and extends significantly the distributional area of *P. dentata* mentioned above. However, the occurrence of this species, as well as other trichodactylids in Central America, still has to be clearly confirmed by further and comprehensive collections.

Remarks: The examination of the HTs of *Dilocarcinus dentatus cayennensis* and *D. dentatus trinidadensis* made clear that the differences in the carapace, chelipeds and abdomen pointed out by PRETZMANN (1968b) can be due to intraspecific variability. Therefore, we consider here both of these species as junior synonyms of *P. dentata*.

Poppiana argentiniana (RATHBUN 1905)

(Figs. 16–23)

Trichodactylus (Dilocarcinus) argentinianus RATHBUN (1904: 242 [nomen nudum]).

Trichodactylus (Dilocarcinus) argentinianus: RATHBUN (1905: pl. 18, figs. 5–6). — Type locality: Argentina, Prov.

de Santa Fé, Las Garzas. The original description of this species was based on 2 ♂ STs from different localities in Argentina; BOTT (1969) restricted the type locality to Las Garzas, therefore the specimen from the MNHN should be considered as the LT. — Lectotype [designated herewith]: ♂ (MNHN BP-40), Argentina, Prov. de Santa Fé, Las Garzas [28°50' S, 59°29' W], 25 km from d'Ocampo, 1904, R. WAGNER. — Paratypes: 1 ♂ (31.2:24.0) (USNM 32012), Argentina, Prov. Chaco, Resistencia, 1893, A. BORELLI; 3 ♂♂ (? ?, 28.5:23.5) (MZUT Cr 289), idem.

Trichodactylus (Dilocarcinus) argentinianus — RATHBUN (1906a: 60, text-fig. 129; 1906b: 504); COIFMANN (1939: 112).

Trichodactylus argentinianus — FREIRE & REBELLO NETO (1921: 134).

Dilocarcinus argentinianus — PRETZMANN (1968: 75); RODRIGUEZ (1992: 108, figs. 14D, 38A–F).

Dilocarcinus (Poppiana) argentinianus — LOPRETTI (1976: 68, 88, figs. 1, 30–33).

Poppiana argentiniana — BOTT (1969: 52, pl. 12, figs. 21a–b; pl. 21, fig. 52); PILLERI (1972: 104, pl. 1); RODRÍGUEZ (1981: 48); MORRONE & LOPRETTI (1994: 100, fig. 20).

Poppiana argentiniana — MANNING & HOBBS (1977: 159); PRETZMANN (1979: pl. 3, figs. 6–10); MORRONE & LOPRETTI (1995: 4); MAGALHÃES & TÜRKAY (1996a: 67, 69, 82);

Poppiana argentiniana — MAGALHÃES (2001: 70, 133, 138; 2002: 1100; 2003: 225, 226, figs. 120–121); NG et al. (2008: 187).

Dilocarcinus argentinianus apaluensis: PRETZMANN (1968b: 75).

Trichodactylus (Dilocarcinus) orbicularis? — RATHBUN (1906a: 58 [part., "Bolivia (NOBILI)"]; 1910: 580 [part., "Bolivia?"]]; COLOSI (1920: 15 [part., 3 ♂♂ from "Resistencia, Chaco Argentino (NOBILI)"]); COIFMANN (1939: 113 [part., cf. RATHBUN 1906b]).

Trichodactylus (Valdivia) boliviensis: PARISI (1923: 29, 2 figs.).

Trichodactylus (Valdivia) boliviensis — COIFMANN (1939: 111); FROGLIA & GRIPPA (1986: 278).

Trichodactylus (Dilocarcinus) bachmayeri: PRETZMANN (1968a: 4).

Dilocarcinus bachmayeri — PRETZMANN (1968b: 75).

Poppiana bachmayeri — PRETZMANN (1979: 591, pl. 1, figs. 1–2; pl. 2, figs. 3–5).
